NRM HD machine is a high-tech rotary molder machine suitable to mold biscuits and handling a huge variety of shortbread dough, designed to be adapted so far to all different kinds of recipes.

The big diameter feeder roller, with v-shape grooves grants the perfect filling up of the roller mold in any condition.

The made-in-brass roller mold has engraves molded in acetalic resin, to assure the easiest biscuit release.

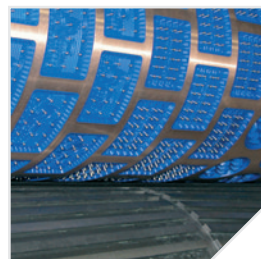

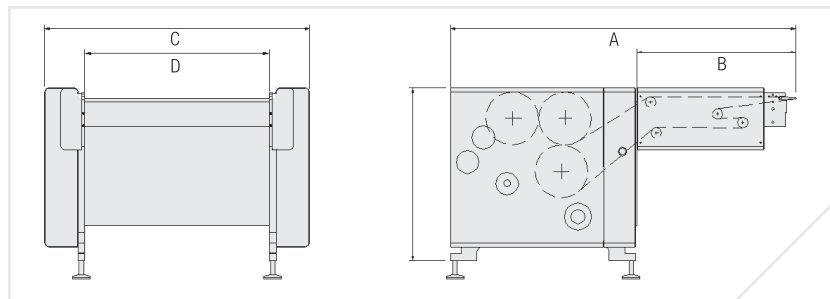

3 independent motors, for feeder roller, mold and rubber one are driving the NRM – HD rotary molder, optimizing the ratio between work speed and product molding.

Knife scraper has two different controls, angle against roller mold and height, adjustable when the machine is running.

A further scraper allows clean up of the conveyor belt and a crosswise-motorized conveyor web collects scraps.

Pneumatic device automatically controls conveyor belt tensioning and avoids aside skid.

Main electric board with "touch screen" display LCD and PLC allows independent control of the speed of the motors and index the main speed to the tunnel oven belt.
